

1) What do you mean by minimum spanning tree?  
 What is application of MST.

A minimum spanning tree or minimum weight spanning tree is a subset of edges of a connected edge weighted undirected graph that connects all the vertices together without any cycle and with the minimum possible total edge weight.

Application:-

- ↳ Designing LAN
- ↳ laying pipelines connecting offshore drilling sites, refineries & consumer markets.
- ↳ Suppose you want to const. highways or railroads spanning several cities then we use concept of MST.

Q2

Algorithm	Time complexity	Space complexity
Prim's	$O(V^2)$	$O(V+E)$
Kruskal	$O(E \log V)$	$O(\log E)$
Dijkstra's	$O(V+E)$	$O(V+E)$
Bellmanford	$O(VE)$	$O(V)$

Q3 Apply Prim & Kruskal's algo to compute MST & its wt.

## Prim's Algo

MST

Q4 Given a weighted Graph. You are also given the shortest path from a source vertex 's' to a given destination vertex 't'. Does the shortest path remain same in a modified graph in following case.

- (i) if wt of every edge is inc by 10 units  
 (ii) if wt of every edge is multiplied by 10 units

Ans (i) The shortest path may change. The reason is that there may be diff. no of edges on different paths from 's' to 't'. For ex let shortest path of wt 15 & has 5 edges. let there be another path with 2 edges & total wt is 25. The wt of shortest is inc by  $5 \times 10$  becomes  $15 + 50$  wt of other path is inc by  $2 \times 10$  it becomes  $25 + 20$  so shortest path changes to other path whose wt is 45.

Ans (ii) If we multiply all edges wt by 10, the shortest path does not change. The reason is simple wt of path from start get multiplied by some amount. The no of edges on a path does not matter.
